Mission

The Economic Stack Initiative aims to apply digital currency applications, tokenization and artificial intelligence to explore the potential of Universal Basic Income. All of our code, research and finding will be open source. Our research and findings will be published here: github.com/economicstack

Economic Stack Initiatives explore models that:
1. Allow every human being in a specific population to have a guaranteed basic income
2. Complement and integrate with our current economic systems in ways that are beneficial and not destructive
3. Work as added layers on top of our current global economic systems
4. Can be tested on a small scale, to minimize unforeseen consequences

We believe in free markets and in the vast global prosperity they have afforded. The Universal Basic Income models explored here will be compatible with current economic systems. Indeed, one goal of our exploration is to propose models that will strengthen economic vitality by stimulating demand.
